

# Pili simulation – 2007-10-23

Snapshots from pili with  $N = 100$  elements

## Simulation parameters

```
NP = ...      % Number of blocks - set by function call
dt = 0.01; % Timestep
nsteps = 50; % Update graphics every nsteps timestep
mass = 0.0004; % Mass of blocks
k_v = 0.1*0.0005; % Velocity friction coefficient
k_w = 0.1*0.0001; % Rotation friction coefficient
U_0 = 0.005; % Potential depth
L = 2.5*0.3; % Potential characteristic length
reverse = false;
t_speed = 0.1; % Speed of trap

% Set epsilon
% EPS can be seen as an stiffness parameter
EPS0 = 0; % element-to-element ball-link parameter
EPS1 = 250*0.5; % bending parameter
EPS2 = 100*2.6; % orthogonal to bending 1 parameter
EPS3 = 100*2.6; % orthogonal to bending 2 parameter
EPST = 100; % pili-to-bead link paramater
```

## Guide to experimenting with the simulation

-- modify parameters --

```
mmolecules13(NP, L_T, make_movie, movie_name) % run simulation
% usage: mmolecules9(NP, L_T, make_movie, movie_name)
% int NP: Number of papA
% double L_T: Pull chain this length, measured in units of NP
% Boolean make_movie: True to record movie
% String movie_name: Save movie to this file, must be provided if
%      make_movie == true

load('22-Oct-2007-19.mat') % Load simulation data

plot(x_save,F2) % Plot simulation output
```
